GLS

GLS SOFTWARE UK LTD
UK refrigerated transport and specialist deliveries

Keep deliveries moving. Bring the paperwork together.

For chilled and frozen hauliers, refrigerated vans and specialist couriers - working across the UK, with European options when you need them.

MAKE MORE OF YOUR TELEMATICS

Already track your vehicles or reefer temperatures?

Tell us which system you use. We can assess an integration that brings the available data alongside your jobs, drivers and delivery evidence.

From the first email to billing review

01 Receive the order

Turn emailed customer instructions into jobs for the traffic office to review. Reduce repeated typing.

02 Confirm price and dispatch

Confirm the load price in Job Control, allocate the job and send the driver collection, delivery and POD links.

03 Keep the delivery evidence

Record temperature requirements, manual readings and exceptions against the job, alongside the POD.

04 POD automatically triggers billing

POD upload triggers billing automatically, reducing delays and helping cash flow. Review and approve before sending; record self-billed jobs separately.

More control for your traffic office

- Driver walkaround checks: phone-based daily checks, exception reporting and one final confirmation.
- Transport Manager integration: reported defects, vehicle holds and audit history, with release kept manual.
- Tractor and trailer allocation: keep the assigned assets linked to the job.
- Customer visibility: own-load access, an office-set delivery window and a 15-minute-delayed location where a feed is connected.

Demo positions are simulated. Delivery estimates exclude customs delays.

Request your free month

One-month free trial with setup guidance. Choose whether to continue afterwards. Bespoke integrations and external provider charges are quoted separately.

Already using telematics? Talk to us.

We can assess your existing system for integration with GLS. The providers below have documented data-sharing routes; they are examples to assess, not completed GLS connections or partnerships.

WEBFLEET

Fleet tracking and tachographs

LINK devices support remote tachograph downloads. WEBFLEET.connect and TachoShare.connect provide integration routes. Cold-chain options are available; check sensors, data access and subscriptions. [1,2]

MICROLISE / TRUTAC

Fleet and compliance data

Remote tachograph downloads and compliance APIs cover driver, vehicle and time data. Temperature monitoring is offered; outward GPS and temperature feeds require confirmation. [3,4]

SAMSARA

Fleet data and tachographs

APIs cover tachograph files and driver activity, plus sensor data. Tachograph APIs are labelled EU-only: confirm UK account eligibility, fitted equipment and permissions. [5,6]

ZF / TRANSICS

Truck and trailer data

TX-TANGO provides fleet integration. Its documented telemetry response includes position, temperature, tachograph information and reefer fields. Availability depends on the product, hardware and access rights. [7,8]

THERMO KING TracKing

Refrigeration and trailer monitoring

TracKing provides temperature, location and alarm information, with a third-party data-sharing web service. Ask your dealer to enable data integration and confirm the available fields. [9,10]

CARRIER LYNX FLEET

Refrigeration and trailer monitoring

Truck & Trailer International APIs offer refrigeration-data integration, including event and alarm updates through webhooks. Confirm account access, installed hardware and the agreed data feed. [11]

Tell us your provider, device and what you want to see.

We will check compatibility and provider access, agree the scope and quote, then test a pilot before activation. Hardware-based feeds can work without relying on the driver's phone. Bespoke integrations and provider charges are quoted separately.

Tachograph data and reefer temperatures are separate feeds. Thermo King and Carrier are listed for refrigeration data, not as confirmed tachograph sources. Other providers are welcome too.
